

AITODO Business Plan: AI-Powered Intelligent Task Management Partner

1. Project Overview

Project Name: AITODO

One-Line Definition: A next-generation intelligent to-do application deeply integrated with AI capabilities, prioritizing data privacy, and capable of "proactive thinking".

Core Concept: Move beyond passive recording; let AI be your task planner.

2. Product Vision & Positioning

- **Vision:** Break away from the traditional "tool-based recording" model of to-do apps. Leverage AI to liberate users from tedious planning and scheduling, achieving highly efficient, automated task management.
- **Core Positioning:**
 - **Deep Intelligence:** AI is not just an assistant but the core engine, responsible for parsing, decomposing, and suggesting.
 - **Ultimate Privacy Protection:** The "Bring Your Own API Key" model returns complete data privacy control to the user.

3. Core Functional Modules

3.1. Foundational Task Base (The Foundation)

- **Exceptional Experience:** Streamlined task creation, editing, and archiving processes.
- **Reliable Tracking:** Supports priority setting, reminders, and categorization tags, building a robust external memory system.

3.2. AI Intelligent Engine (The Brain)

- **Ambiguous Intent Recognition:** Users only need to input a macro idea (e.g., "Get my driver's license this month"). AI automatically decomposes it into specific subtasks like medical checkup, registration, and subject practice sessions.
- **Dynamic Planning Suggestions:** AI proactively suggests optimal daily schedules based on task urgency and historical execution habits.

3.3. Conversational Interface (The Interface)

- **Chat as Creation:** Users interact with AI via natural language, completing task entry and adjustments through conversation.
- **Proactive Sensing:** AI understands context. Upon recognizing information like "remember to bring an umbrella next time" or "need this for tomorrow's meeting," it proactively asks if the user wants to convert it into a formal to-do item.

4. Technical Implementation Path

4.1. Open AI Architecture

- **BYOK (Bring Your Own Key) Model:** AITODO does not embed a fixed AI model. Users independently configure API Keys for models like OpenAI, Claude, or leading domestic LLMs.
- **Flexibility & Cost Control:** Users can choose models based on their needs (e.g., GPT-3.5 for speed, Claude 3 for wisdom). The application provider does not bear the high cost of computing power.

4.2. Data Processing & Security

- **Structured Mapping:** The core backend logic is responsible for converting the **JSON data** (containing titles, steps, dates) returned by the AI into corresponding database entities within the application in real-time.
- **Prompt Engineering:** Establish and continuously optimize a proprietary Prompt library to ensure the stability of AI outputs and the logic of task decomposition.

5. Core Competitive Advantages

- 1 **Privacy Differentiation:** Compared to applications that store all user plans in the cloud, AITODO's direct API connection model garners greater trust from professional, high-net-worth, and privacy-conscious users.
- 2 **Efficiency Differentiation:** Traditional tools require 10 manual inputs. AITODO can generate a 10-step plan through one conversation or a single sentence input, improving efficiency several times over.
- 3 **Zero Compute Burden:** Compute costs are borne by the user via their API usage, allowing the project to maintain a lean, asset-light operational model.

6. Business Model Design

- 1 **Paid Download / Subscription Model:** Users pay for AITODO's elegant UI/UX design, advanced Prompt templates, and superior structured processing tools.
- 2 **Multi-Platform Distribution:** Cover iOS, Android, macOS, and web clients, enabling seamless synchronization across all devices.
- 3 **Developer Community:** Future potential to open a Prompt marketplace, allowing users to share/sell AI templates for specific scenarios (e.g., postgraduate exam planning, renovation management).

7. Development Roadmap

- **Phase 1 (MVP):** Complete core task management features and structured integration with the OpenAI API, achieving "one-click task decomposition."
- **Phase 2 (Advanced):** Introduce the context-aware conversational interface and optimize the mobile voice input experience.
- **Phase 3 (Ecosystem):** Support more domestic and international LLMs, build a library of user-personalized task templates, and explore B2B productivity scenarios.

AITODO — Not just a recorder, but your execution brain.
